Lecture 04: Arrays

AITI Nigeria Summer 2012

University of Lagos.

MISTI

What are Arrays?

- An array is a series of compartments to store data.
- Essentially a block of variables.
- In Java, arrays can only hold one type.
- For example, `int` arrays can hold only integers and `char` arrays can only hold characters.

Array Visualization and Terms

- Arrays have a type, name, and size.
- Array of three integers named `prices` :
  - `prices` : 

- Array of four Strings named `people`:
  - `people` : 
- We refer to each item in an array as an *element*.
- The position of each element is known as its *index.*

Declaring an Array

- Array declarations similar to variables, but use square brackets:
  - `datatype[] name;`
- For example:
  - `int[] prices;`
  - `String[] people;`
- Can alternatively use the form:
  - `datatype name[];`
  - `int prices[];`

Allocating an Array

- Unlike variables, we need to *allocate* memory to store arrays. (*malloc()* in C.)
- Use the `new` keyword to allocate memory:
  - `name = new type[size];`
  - `prices = new int[3];`
  - `people = new String[5];`
- This allocates an integer array of size 3 and a String array of size 5.
- Can combine declaration and allocation:
  - `int[] prices = new int[3];`

Array Indices

- Every element in an array is referenced by its index.
- In Java, the index starts at 0 and ends at *n-1*, where *n* is the size of the array.
- If the array `prices` has size 3, its valid indices are 0, 1, and 2.
- Beware “Array out of Bounds” errors.

Using an Array

- We access an element of an array using square brackets `[]`:
  - `name[index]`
- Treat array elements just like a variable.
- Example assigning values to each element of `prices`:
  - `prices[0] = 6;`
  - `prices[1] = 80;`
  - `prices[2] = 10;`

Using an Array

- We assign values to elements of String arrays in a similar fashion:
  - `String[] people;`
  - `people = new String[5];`
  - `people[0] = "Michael";`
  - `people[1] = "Michelle";`
  - `people[2] = "Cory";`
  - `people[3] = "Zach";`
  - `people[4] = "Julian";`

Initializing Arrays

- You can also specify all of the items in an array at its creation.
- Use curly brackets to surround the array's data and separate the values with commas:
  - `String[] people = {"Michael", "Michelle", "Zach", "Cory", "Julian"};`
  - `int[] prices = {6, 80, 10};`
- All the items must be of the same type.

Vocabulary Review

- Allocate - Create empty space that will contain the array.
- Initialize - Fill in a newly allocated array with initial values.
- Element - An item in the array.
- Index - Element’s position in the array.
- Size or Length - Number of elements.

Review 1

Which of the following sequences of statements does not create a new array?

a)
```
int[] arr = new int[4];
```

b)
```
int[] arr;
arr = new int[4];
```

c)
```
int[] arr = { 1, 2, 3, 4};
```

d)
```
int[] arr;
```

Lengths of Array

- Each array has a default *field* called `length`
- Access an array's `length` using the format:
  - `arrayName.length;`
- Example:
  - `String[] people = {"Michael", "Michelle", "Zachary", "Cory", "Julian"};`
  - `int numPeople = people.length;`
- The value of `numPeople` is now 5.

- Arrays are always of the same size. Their lengths cannot be changed once they are created.

Example

- Sample Code:

```
String[] people = {“Gleb”,
  “Lawrence”, “Michael”,
  “Stephanie”, “Zawadi”};
for(int i=0; i<names.length; i++)
  System.out.println(names[i]+”!");
```

- Output:

```
Gleb!
Lawrence!
Michael!
Stephanie!
Zawadi!
```

Review

- Given this code fragment:
  - `int[] data = new int[10];`
  - `System.out.println(data[j]);`
- Which are legal values of `j`?

a) -1
b) 0
c) 3.5
d) 10

Review

- Decide what type and size of array (if any) to store each data set:
  - Score in each quarter of a football game.

```
int[] quarterScore = new int[4];
```

  - Your name, date of birth, and height.

```
Not appropriate. Different types.
```

  - Hourly temperature readings for a week.

```
float[] tempReadings = new float[168];
```

  - Your daily expenses for a year.

```
float[] dailyExpenses = new float[365];
```

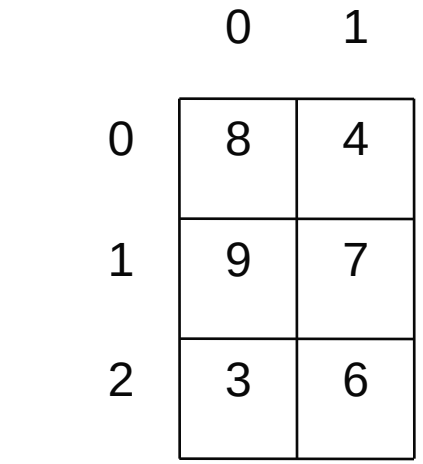
Exercise

- What are the contents of `c` after the following code segment?

```
int [] a = {1, 2, 3, 4, 5};
int [] b = {11, 12, 13};
int [] c = new int[4];
for (int j = 0; j < 3; j++) {
   c[j] = a[j] + b[j];
}
```

2-Dimensional Arrays

- The arrays we've used so far can be thought of as a single row of values.
- A 2-dimensional array can be thought of as a grid (or matrix) of values.
- Each element of the 2-D array is accessed by providing two indices: a row index and a column index.
- A 2-D array is actually just an array of arrays



value at row index 2, column index 0 is 3

2-D Array Example

- Example: A landscape grid of a 20 x 55 acre piece of land. We want to store the height of the land at each row and each column of the grid.
- We declare a 2-D array two sets of square brackets:
  - `double[][] heights;`
  - `heights = new double[20][55];`
- This 2-D array has 20 rows and 55 columns
- To access the acre at row index 11 and column index 23: `heights[11][23]`
